What are Routes?
>>> App routing is used to map the specific URL with the associated function that is intended to perform some task

- **Use the @app.route() decorator to bind a URL to a function.**

- **Dynamic URL Parameters: Pass values in the URL and process them in the view function.**

Code Examples

```python
@app.route('/')
def home():
    return "This is the Home Page!"

@app.route('/about')
def about():
    return "This is the About Page!"
```

Thank You
